There are many businesses that are currently using different software packages to track business functions in several different areas such as project management, billing, payroll and others. Each of these packages usually contains different data structures so it's pretty hard to keep tabs on them in one common product. This usually causes a problem when you want to have one common product that can help with business reporting, making projections and making daily business decisions.

One company that has combined all of these different areas together into one common product is Tenrox and their Project Workforce Management solution is a unique solution that receives our Editor's Choice Award for functionality and scalability.

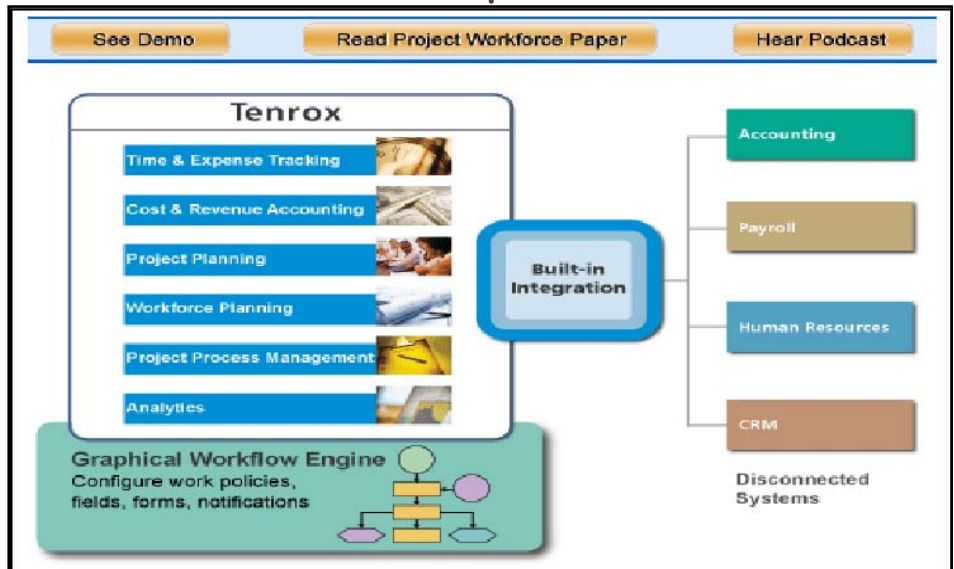

This product is a webbased software package that includes an excellent project management system that can even import current projects that are running under Microsoft Project. Managers have the ability to assign tasks that are to be performed by an individual. At some point they can view the same information that is assigned to a group level. Project level information can also be viewed and if necessary drilled down to a certain group and individual task if necessary. Managers can also find trouble spots in a project plan where there may be the need to add extra resources within the group to keep up with the timeline and to avoid falling behind in the delivery date of a project.

## It can even import Microsoft Project information into the system.

Rather than keeping the Tenrox Project Workforce Management solution just a product that deals with project management, it also integrates with payroll and billing. Managers can view billing and nonbilling hours and management them accordingly. Employers can also management expense accounts that are often associated with this type of work. Contractors can enter their expenses then a webbased workflow can be used to see the status of any expense, approve or deny it as well.

There is a certain amount of time to install each module that you want to use and there is a learning curve to using the solution correctly.

If you're looking for a common way to operate your business and in an organized manner, then you should consider the Tenrox Project Workforce webbased system. The cost of the product will depend on the available modules chosen as well as the number of users that will access the system.

We think owners of the solution will be impressed by the number of prebuilt reports that come with each module in addition to the ability to build adhoc reports as they become necessary.

Tenrox solutions are available on-demand or on-premise

Under the on-demand model, no additional hardware or software is required other than access to a web browser as the entire solution is hosted by Tenrox.

A Microsoft web server and SQL Server 2005 will be required if using Tenrox on-premise installed on your company's network

Company sales personnel can provide a quote based on these numbers and you can Visit their web site for additional information at [www.tenrox.com](http://www.tenrox.com).
